HAVASAZ DUCTED FANCOIL.....	20

## Ducted fan coil units offer design and equipment location flexibility.

Choice of 4 models, each available in 8 sizes

For - 2 – pipe 4 –pipe and electric heat systems with optional factory furnished controls.

Up to 0.4 in.w.g duct static with some models

### Features / Benefits

The HDFC series ducted fan coil units delivers quiet. Dependable air conditioning in a wide range of capacities Units providing air flow 800 TO 2000 CFM are designed to economically fill multiroom application requirements in apartments , motels , and office building .

These easy – to – install units are available in horizontal models for cabinet or furred – in applications. Casings and frame are fabricated from tough , heavy gage galvanized steel models ADFA , FC and FE feature a galvanized finish as – installed options(including coil, motors, filters, drain pans and electric strip heaters) can custom – tailor your units to the exact conditions of your applications.

### Low – Cost Installation

Each unit is designed to occupy a minimum space. This feature along with convenient wiring and piping connections means the ADF reduces costs on renovations or new constructions sites Grommeted mounting holes or slots on top of the unit speed hanging Quiet.

## Dependable performance

All ADF series unit are built to operate unobtrusively, with quiet motors and low fan speed.

Plastophom 20 mm. thick, absorbs operating sound in fully insulated casings. Efficient operation ADF quality reduces service and maintenance expenses. Condensate drain pan is stainless steel so corrosion is omitted and long, trouble – free life is assured.

MODEL	NOMINAL AIR FLOW (C.F.M)	COOLING					HEATING
		ENTERING WATER (°F)	WATER FLOW (GPM)	WATER PRESSURE DROP (FT.W.G)	TOTAL (BTU/HR)	SENSIBLE (BTU/HR)	CAPACITY (BTU/HR)

### NOTES:

1. Total heat (TH) and Sensible Heat (SH) are expressed in MBH.
2. Pressure Drop (PD) is Give in Feets Of Water.
3. Water Temperature Rise = Total MBH/(0.5\*GPM).
4. Temperatures Are in F

### NOTES:

1. Total heat (TH) and Sensible Heat (SH) are expressed in MBH.
2. Pressure Drop (PD) is Give in Feet Of Water.
3. Water Temperature Rise = Total MBH/(0.5\*GPM).
4. Temperatures Are in F

### NOTES:

1. Heating capacities expressed in MBH and are based on nominal CFM and 70°F e.a.t.
2. For Entering Water Air temperature not tabulated apply the Hot Water Capacities Correction Factor below to the capacity at 180 to obtain the adjusted heating capacity.
3. Pressure Drop (PD) is given in feet of Water and based 120 EWT.

## HOT WATER CAPACITY FACTOR

### NOTES:

1. Adjusted heating BTU = Base heating BTUH(@ NOMINAL CFM, 180 EWT, 70 eat)\*Hot Water Capacity.

## UNIT SELECTION

1. Select a tentative unit size and row of cooling coil based on Cooling Capacities at CFM at the design entering air temperature, from pages 5 through 14. Select heating coils from the Hot Water Heating at nominal CFM, page 15.

### NOTE:

The selection Yielding the fewest rows of coil, even though may necessitate an increase in unit size, is usually the most economical.

2. For a give unit size the size and capacity is dependent on the air flow. Therefore, the actual CFM for cooling and heating must be determined from the CFM VS. EXTERNAL STATIC PRESSURE TABLE, PAGE 6&7 The heating CFM will usually be greater than the cooling CFM since during cooling, the coil will usually be wet. Wet coil conditions occur when the sensible heat/ratio is 0.91 or less. Electric heating is not debated.

3. From the capacity Correction Factors Table, page 8, determine the total and sensible factors(Ct and Cs) for the actual cooling CFM, and the sensible factor for the actual heating CFM. If the unit is to operate at altitude, multiply the Capacity Correction Factors by the appropriate Altitude Correction Factors, page 8.

4. To obtain the actual cooling capacities, multiply the cooling capacities at nominal CFM, page 5 through 14 (step1), by the appropriate

Capacity Correction Factors (step3).

Actual MBH = nominal MBH (page 9 -14)\* capacity Factor (page 8)\*Altitude Factor (page 8)

NOTE: All ducted models accept a maximum of 6 rows of coil.

5. Hot Water Heating Capacities at nominal CFM, page 15 are based on 180 EWT and 70 EAT and must be adjusted in accordance with the Capacities Correction Factor (Step 3) and The Hot Water Heating Capacity Correction Factor(EWT and EAT), page 15.

Actual MBH = Nominal MBH (page 15)\*Cs Capacity Factor (page 16) \* SH Altitude Factor (page 8)

6. Cooling and heating Water Pressure Drops are given in the nominal Capacity Tables, page 9 through 15.

### EXAMPLE:

Wb Room heating load: 78200 BTUH. Entering Water temperature: 45 cooling, 180 heating.

Water flow rate:10 GPM cooling,2 GPM heating  
Maximum water pressure drop: 16 FT. cooling External static  
pressure drop”0.3 IN.W.G  
Altitude: 4000 ft.

## SOLUTION:

1. Tentatively selection a DE 16 with a 4Row coil from the nominal Cooling Capacity Tables, page 7, respectively.  
The nominal heating capacity is 132 MBH at 180 EWT and 70 EAT (page 5).

2. From page 7, the actual dry coil or heating air flow at 0.3 IN.W.G is 1549 CFM .since the SH/TH ratio is 0.94, the coil is wet. Therefore, the actual cooling air flow is  $1549 \text{ CFM} \times 0.92 = 1425 \text{ CFM}$ .

3. From page 8, the Capacity Correction Factor are 0.98for hot water heating 0.93 for total cooling, and 0.92 for sensible cooling .From page 8,the total cooling and sensible cooling/heating Altitude Correction Factor are 0.96 and 0.86,respectively.

4. Multiply the Cooling Capacities (at nominal CFM and the design entering air temperature (76DB/65WB) determined in step 1) by the Capacity Correction and Altitude Correction Factors determined in step3.

Actual sensible cooling capacity=  $36.1 \text{ MBH} \times 0.92 \times 0.86 = 28562 \text{ BTUH}$ .

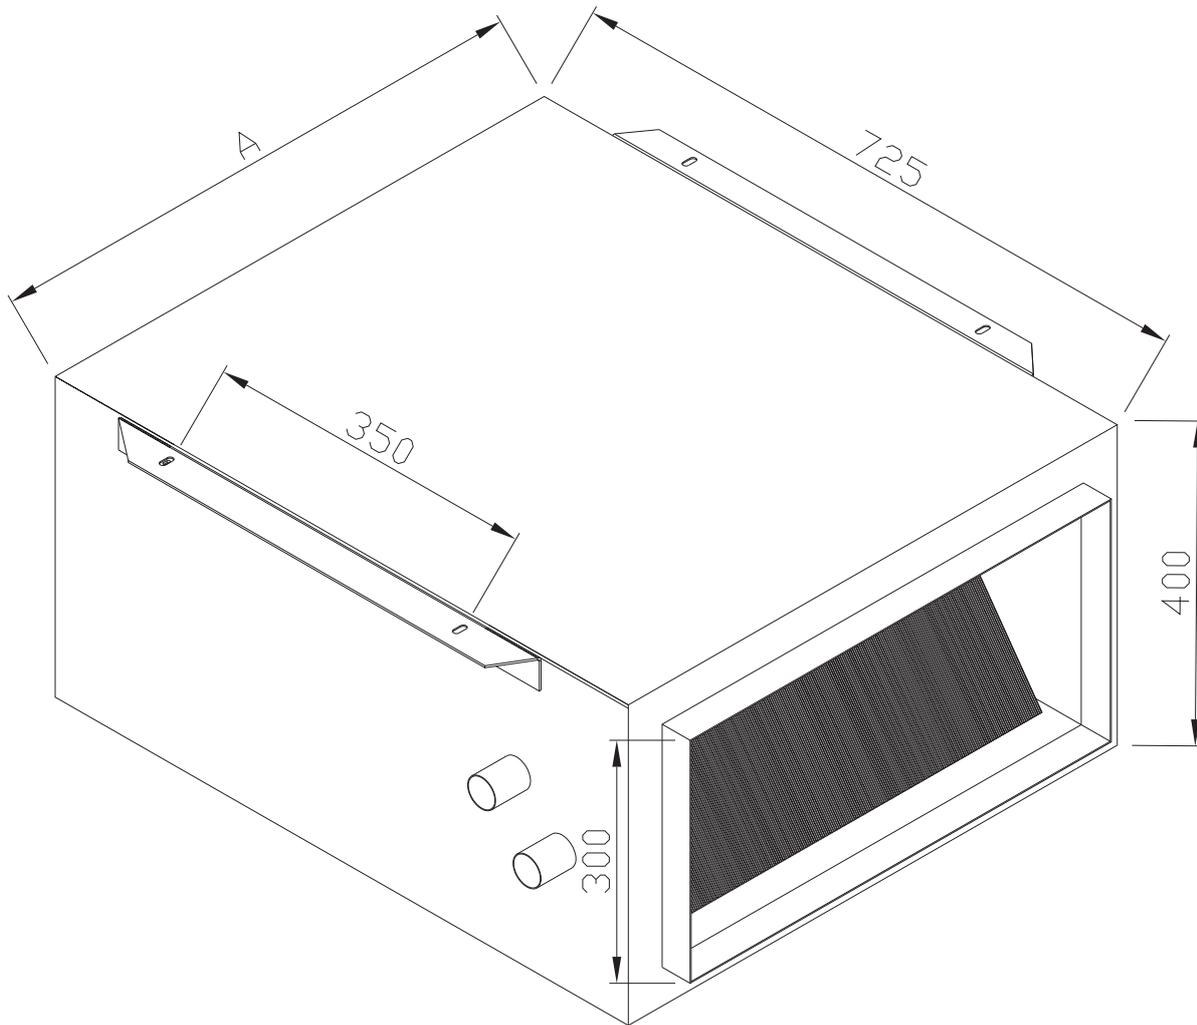

Actual total cooling capacity =  $47.8 \text{ MBH} \times 0.93 \times 0.96 = 42676 \text{ BTUH}$

5. From the Hot Water Heating Capacities Tables, page 15, the heating capacity at nominal CFM, 180 EWT, and 70 EAT, is 132 MBH. The Hot Water Capacity Correction Factor, page 8 is 0.95(180EWT, 76 EAT).

Actual hot water heating capacity =  $132 \text{ MBH} \times 0.98 \times 0.95 \times 0.86 = 105687 \text{ BTUH}$ .

6. From the capacity tables ,page 10 and 15 , the cooling pressure drop for 10 GPM is 10.4 Ft. and the hot water pressure drop for 2 GPM is 5 Ft.
